Design a Restaurant Management system

Let's design a restaurant management system.

We'll cover the following

A Restaurant Management System is a software built to handle all restaurant activities in an easy and safe manner. This System will give the Restaurant management power and flexibility to manage the entire system from a single portal. The system allows the manager to keep track of available tables in the system as well as the reservation of tables and bill generation.

System Requirements#

We will focus on the following set of requirements while designing the Restaurant Management System:

1. The restaurant will have different branches.
2. Each restaurant branch will have a menu.
3. The menu will have different menu sections, containing different menu items.
4. The waiter should be able to create an order for a table and add meals for each seat.
5. Each meal can have multiple meal items. Each meal item corresponds to a menu item.

6. The system should be able to retrieve information about tables currently available to seat walk-in customers.
7. The system should support the reservation of tables.
8. The receptionist should be able to search for available tables by date/time and reserve a table.
9. The system should allow customers to cancel their reservation.
10. The system should be able to send notifications whenever the reservation time is approaching.
11. The customers should be able to pay their bills through credit card, check or cash.
12. Each restaurant branch can have multiple seating arrangements of tables.

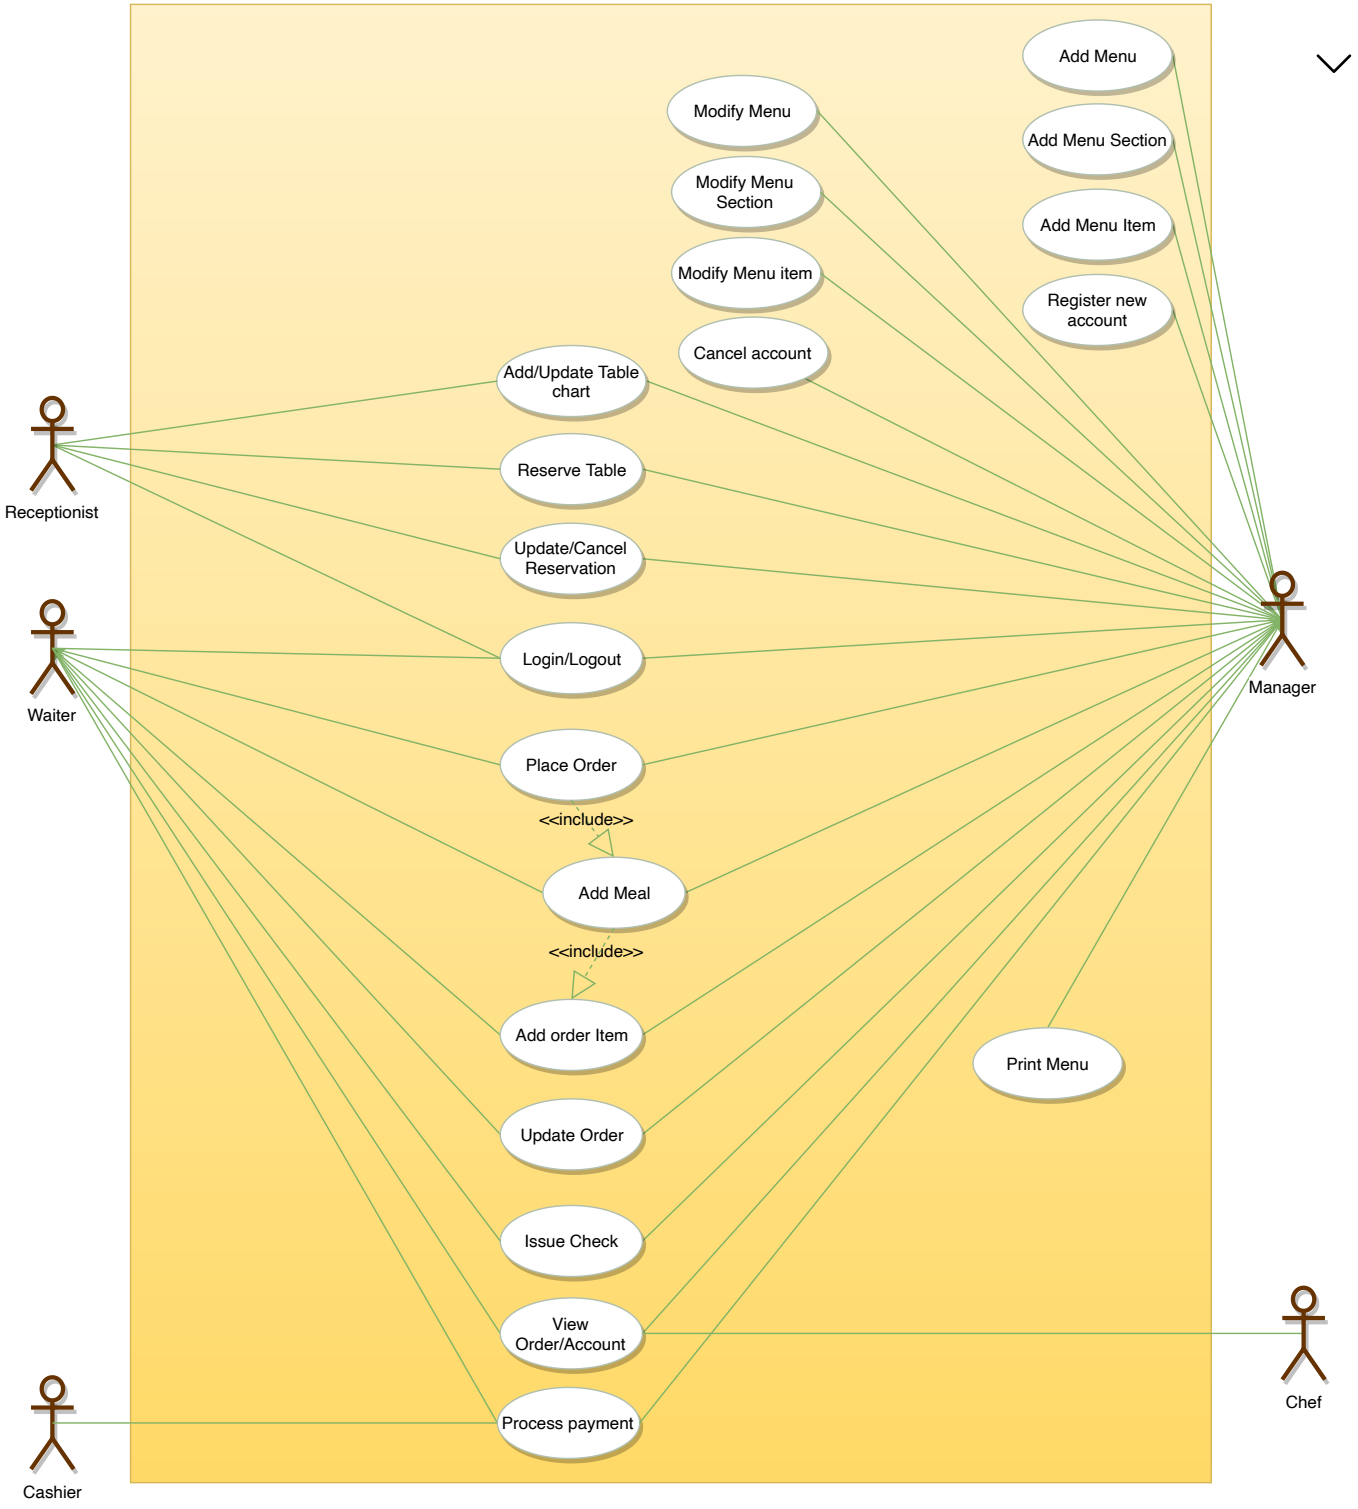
Use case diagram#

Here are the main Actors in our system:

- **Receptionist:** Mainly responsible for adding and modifying tables and their layout, and creating and canceling table reservations.
- **Waiter:** To take/modify orders.
- **Manager:** Mainly responsible for adding new workers and modifying the menu.
- **Chef:** To view and work on an order.
- **Cashier:** To generate checks and process payments.
- **System:** Mainly responsible for sending notifications about table reservations, cancellations, etc.

Here are the top use cases of the Restaurant Management System:

- **Add/Modify tables:** To add, remove, or modify a table in the system.
- **Search tables:** To search for available tables for reservation.
- **Place order:** Add a new order in the system for a table.
- **Update order:** Modify an already placed order, which can include adding/modifying meals or meal items.
- **Create a reservation:** To create a table reservation for a certain date/time for an available table.
- **Cancel reservation:** To cancel an existing reservation.
- **Check-in:** To let the guest check in for their reservation.
- **Make payment:** Pay the check for the food.

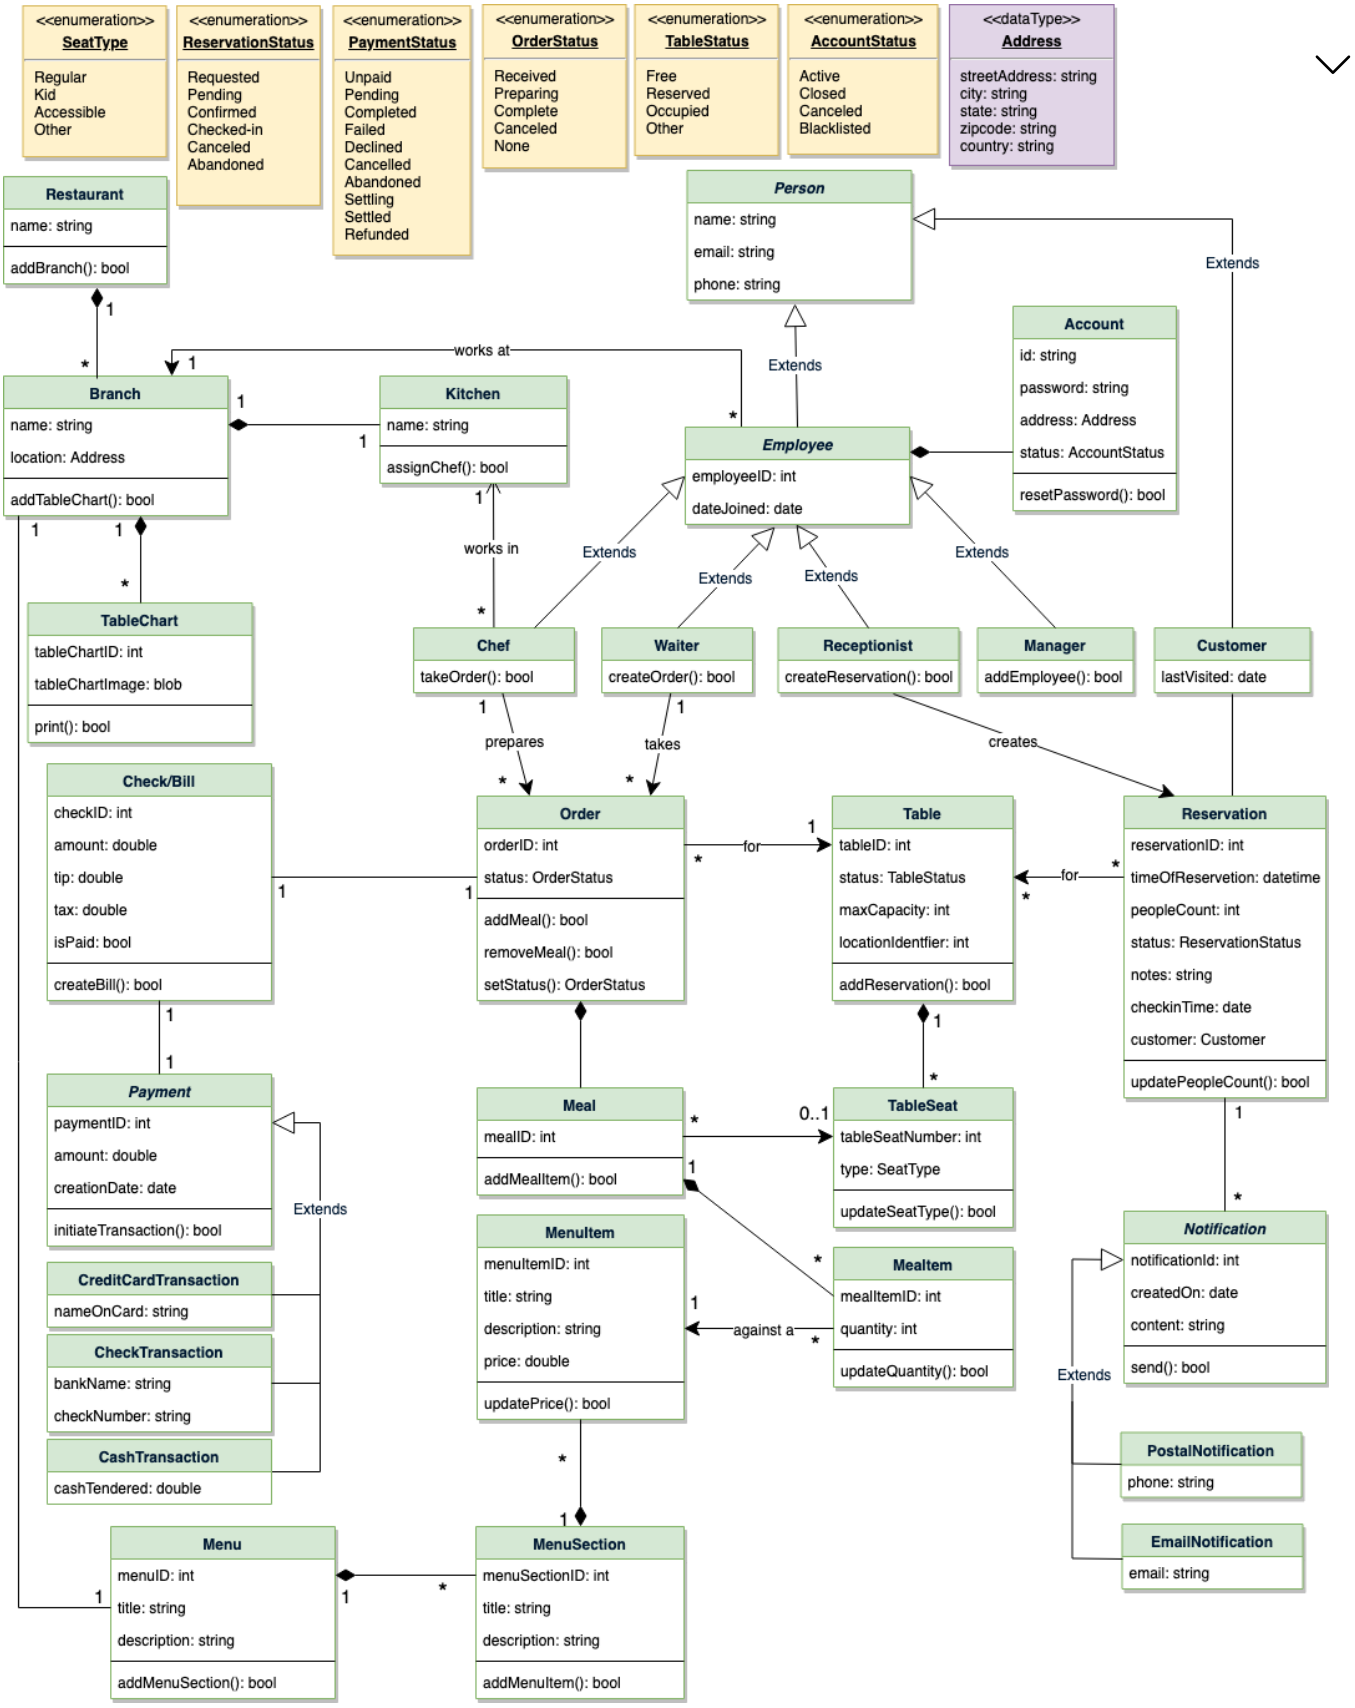


Use case diagram

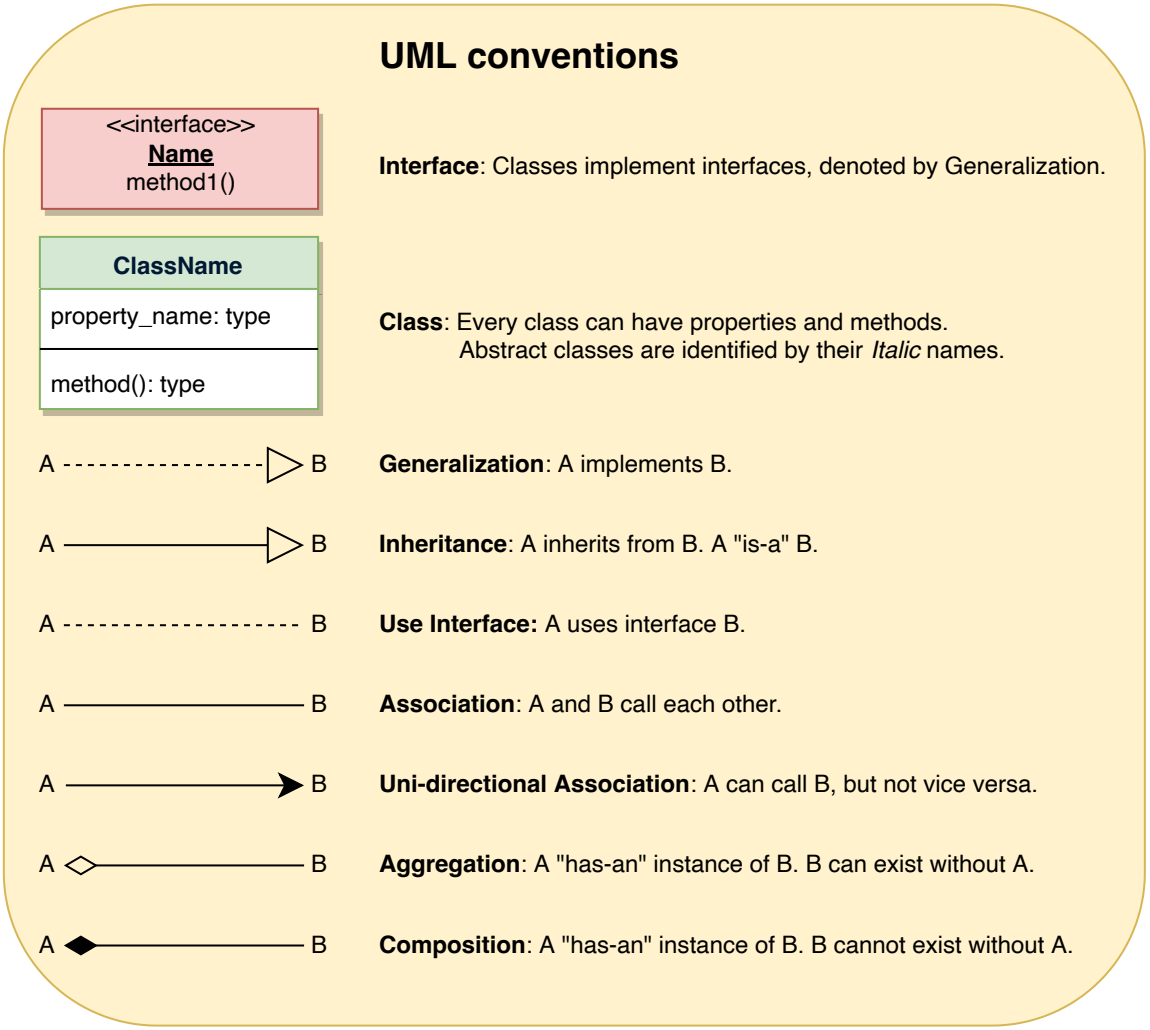
Class diagram#

Here is the description of the different classes of our Restaurant Management System:

- **Restaurant:** This class represents a restaurant. Each restaurant has registered employees. The employees are part of the restaurant because if the restaurant becomes inactive, all its employees will automatically be deactivated.
- **Branch:** Any restaurants can have multiple branches. Each branch will have its own set of employees and menus.
- **Menu:** All branches will have their own menu.
- **MenuSection and MenuItem:** A menu has zero or more menu sections. Each menu section consists of zero or more menu items.
- **Table and TableSeat:** The basic building block of the system. Every table will have a unique identifier, maximum sitting capacity, etc. Each table will have multiple seats.
- **Order:** This class encapsulates the order placed by a customer.
- **Meal:** Each order will consist of separate meals for each table seat.
- **Meal Item:** Each Meal will consist of one or more meal items corresponding to a menu item.
- **Account:** We'll have different types of accounts in the system, one will be a receptionist to search and reserve tables and the other, the waiter will place orders in the system.
- **Notification:** Will take care of sending notifications to customers.
- **Bill:** Contains different bill-items for every meal item.

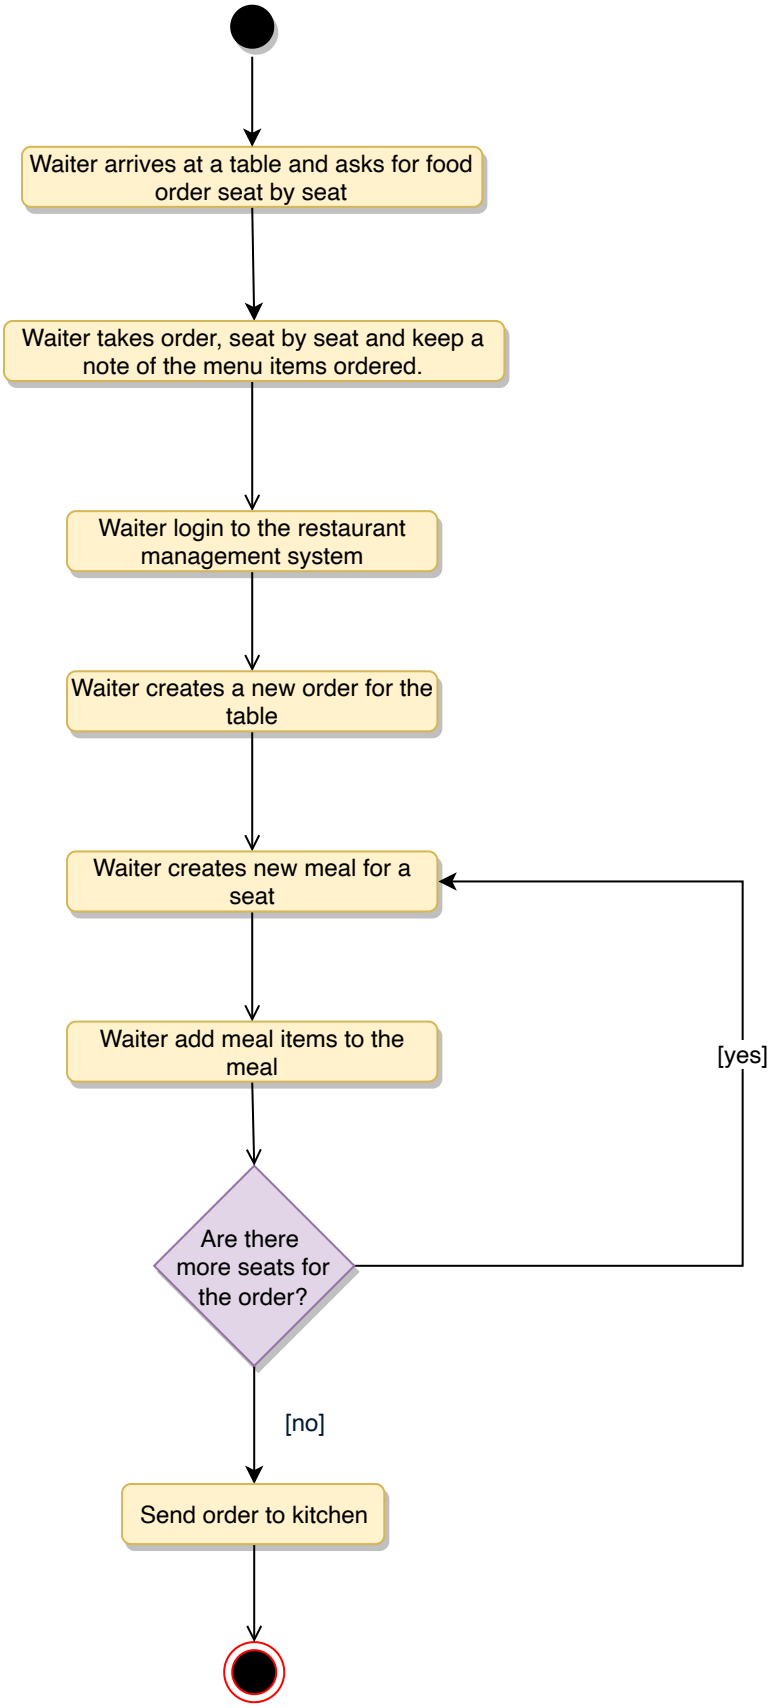


Class diagram

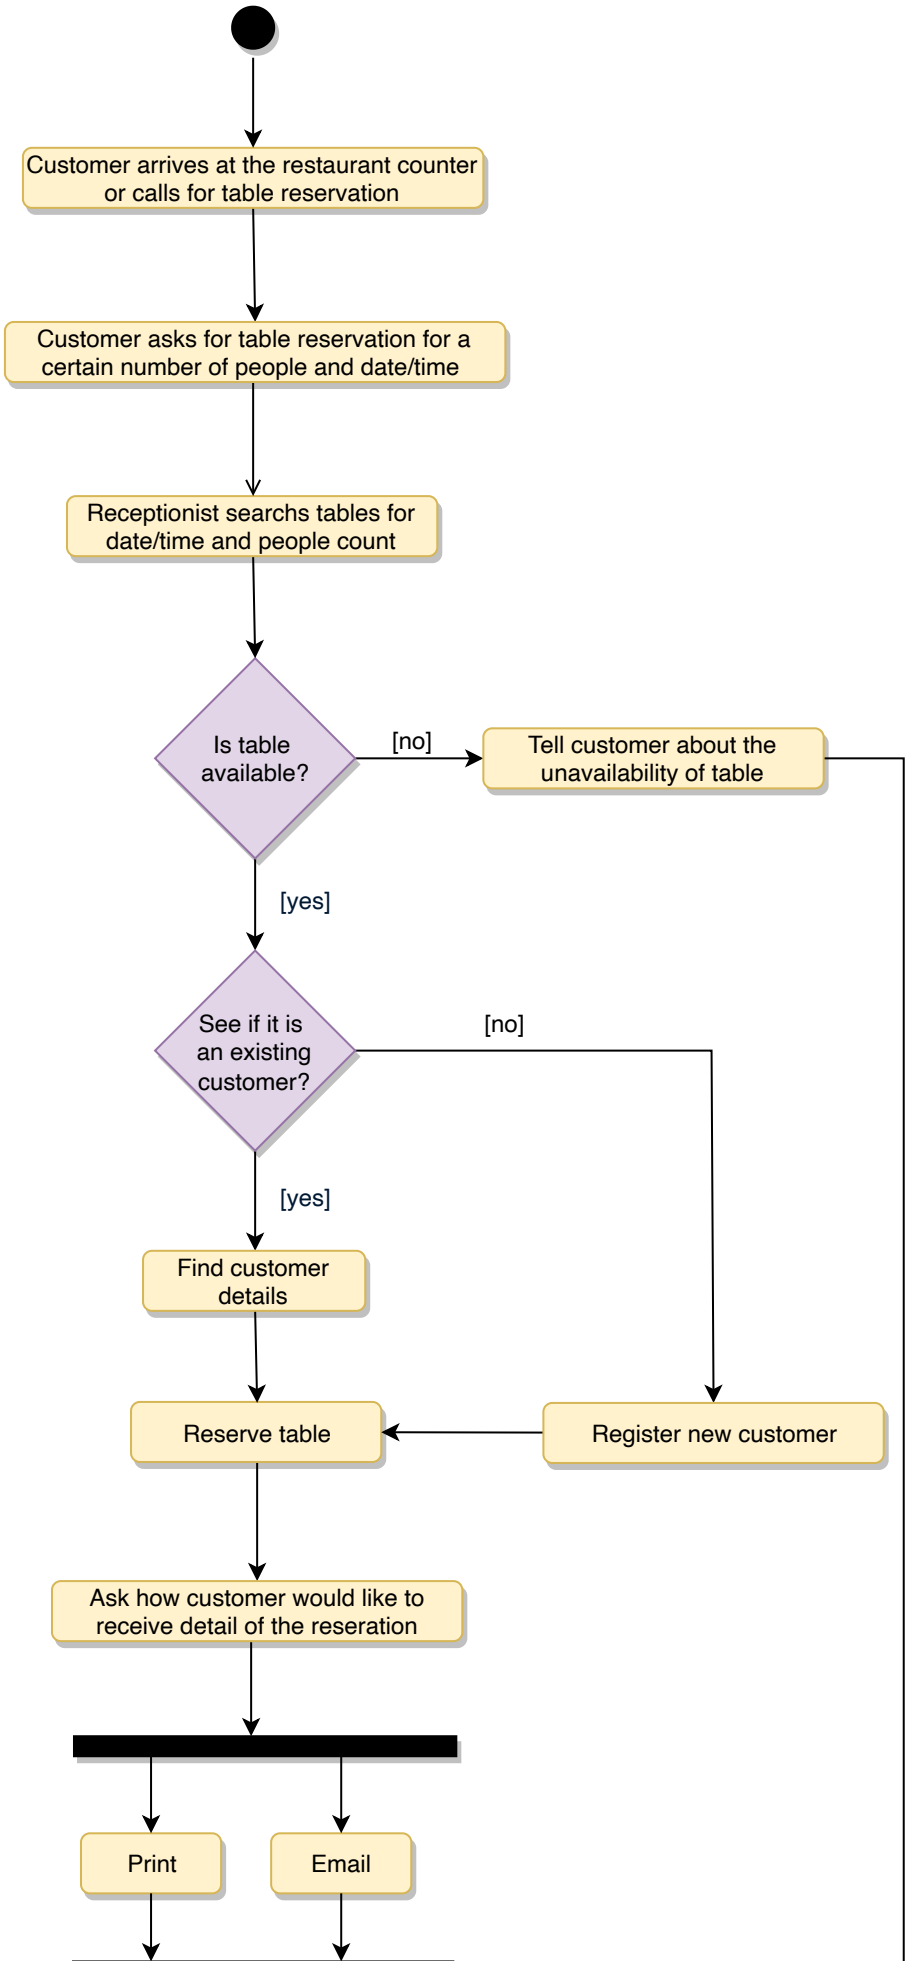


Activity diagrams#

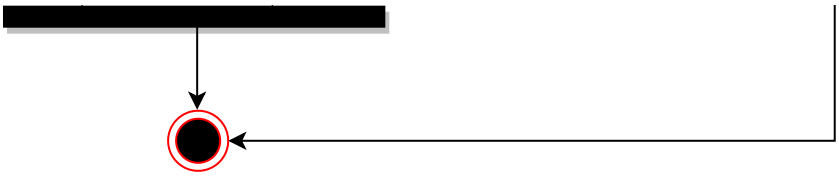
Place order: Any waiter can perform this activity. Here are the steps to place an order:



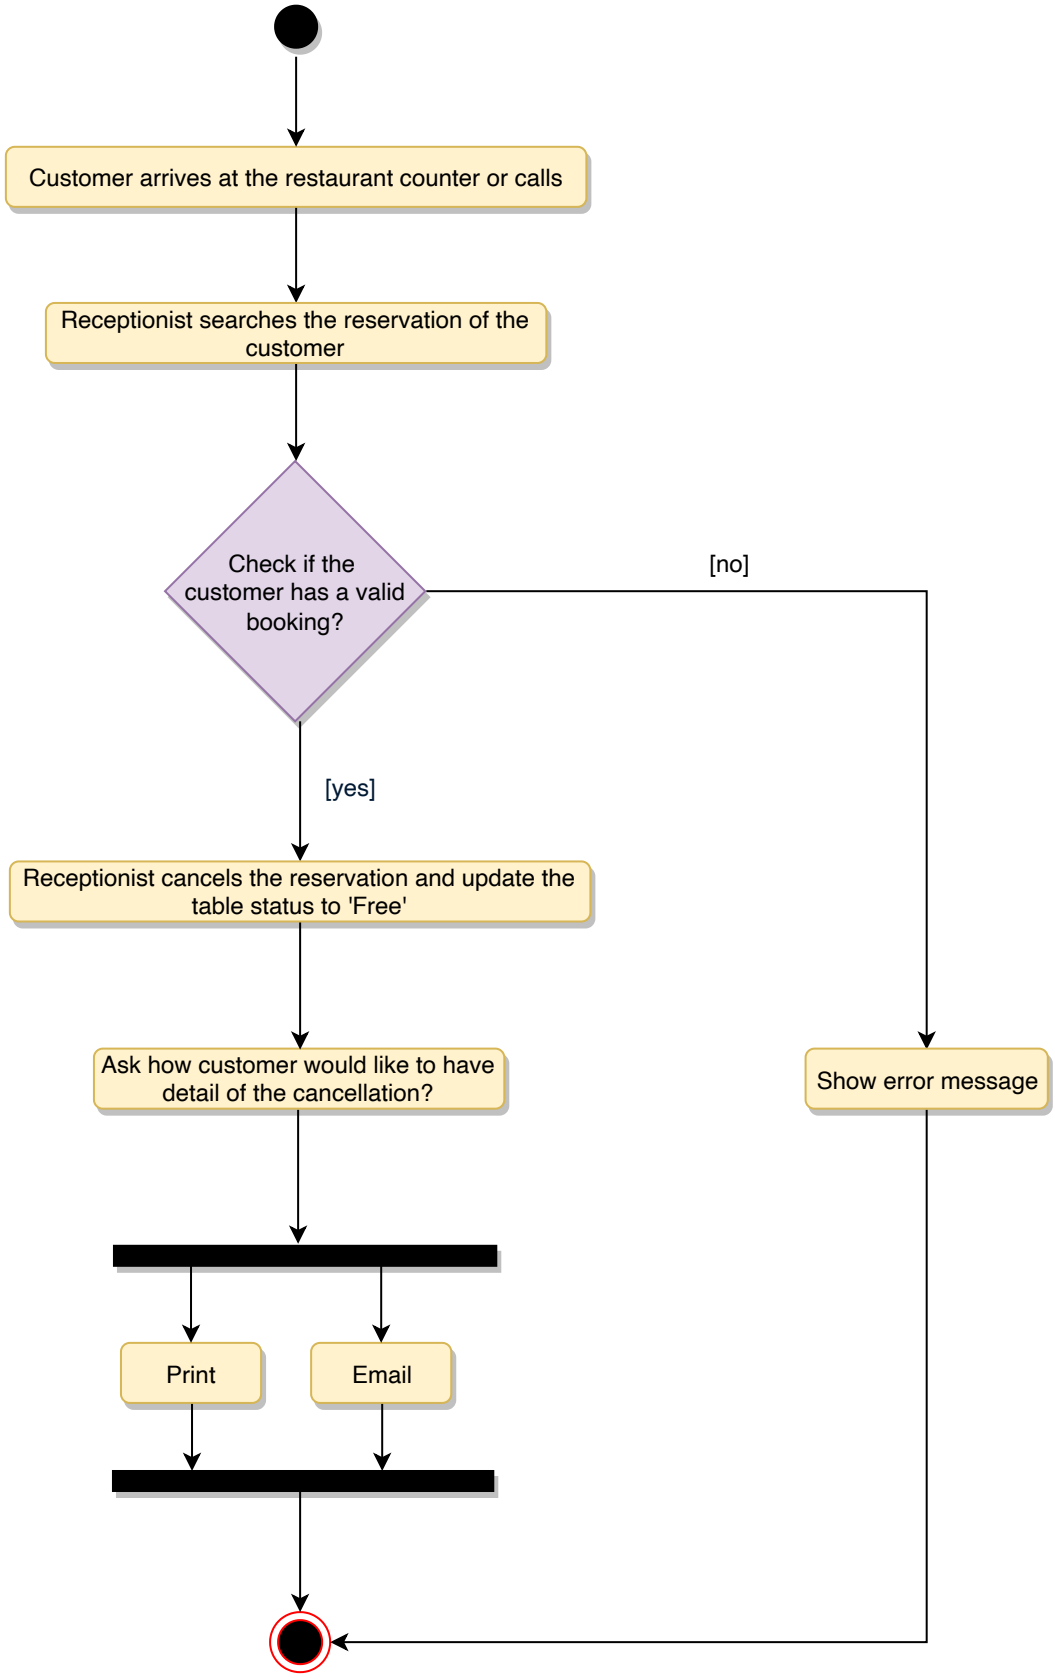
Make a reservation: Any receptionist can perform this activity. Here are the steps to make a reservation:



Customer arrives at the restaurant counter or calls for table reservation
Customer asks for table reservation for a certain number of people and date/time
Receptionist searchs tables for date/time and people count
Is table available?
[no]
Tell customer about the unavailability of table
[yes]
See if it is an existing customer?
[no]
[yes]
Find customer details
Reserve table
Register new customer
Ask how customer would like to receive detail of the reseration
Print
Email



Cancel a reservation: Any receptionist can perform this activity. Here are the steps to cancel a reservation:



Code#

Here is the high-level definition for the classes described above.

Enums, data types, and constants: Here are the required enums, data types, and constants:

Java

```
4
5  public enum SeatType {
6    REGULAR, KID, ACCESSIBLE, OTHER
7  }
8
9  public enum OrderStatus {
10   RECEIVED, PREPARING, COMPLETED, CANCELED, NONE
11 }
12
13 public enum TableStatus {
14   FREE, RESERVED, OCCUPIED, OTHER
15 }
16
17 public enum AccountStatus {
18   ACTIVE, CLOSED, CANCELED, BLACKLISTED, BLOCKED
19 }
20
21 public enum PaymentStatus {
22   UNPAID, PENDING, COMPLETED, FILLED, DECLINED, CANCELLED, ABANDONED, SETTLI
23 }
24
25 public class Address {
26   private String streetAddress;
27   private String city;
28   private String state;
29   private String zipCode;
30   private String country;
31 }
```

Account, Person, Employee, Receptionist, Manager, and Chef: These classes represent the different people that interact with our system:

Java

```
1  // For simplicity, we are not defining getter and setter functions. The read
2  // assume that all class attributes are private and accessed through their r
3  // public getter methods and modified only through their public setter funct
4
```

```
4
5  public class Account {
6    private String id;
7    private String password;
8    private Address address;
9    private AccountStatus status;
10
11   public boolean resetPassword();
12 }
13
14 public abstract class Person {
15   private String name;
16   private String email;
17   private String phone;
18 }
19
20
21 public abstract class Employee extends Person {
22   private int employeeID;
23   private Date dateJoined;
24
25   private Account account;
26 }
27
28 public class Receptionist extends Employee {
```

Restaurant, Branch, Kitchen, TableChart: These classes represent the top-level classes of the system:

Java

```
1  public class Kitchen {
2    private String name;
3    private Chef[] chefs;
4
5    private boolean assignChef();
6  }
7
8  public class Branch {
9    private String name;
10   private Address location;
11   private Kitchen kitchen;
12
13   public Address addTableChart();
14 }
```

```
15
16  public class Restaurant {
17    private String name;
18    private List<Branch> branches;
19
20    public boolean addBranch(Branch branch);
21  }
22
23  public class TableChart {
24    private int tableChartID;
25    private byte[] tableChartImage;
26
27    public bool print();
28  }
```

Table, TableSeat, and Reservation: Each table can have multiple seats and customers can make reservations for tables:

Java

```
1   public class Table {
2     private int tableID;
3     private TableStatus status;
4     private int maxCapacity;
5     private int locationIdentifier;
6
7     private List<TableSeat> seats;
8
9     public boolean isTableFree();
10    public boolean addReservation();
11
12    public static List<Table> search(int capacity, Date startTime) {
13      // return all tables with the given capacity and availability
14    }
15  }
16
17  public class TableSeat {
18    private int tableSeatNumber;
19    private SeatType type;
20
21    public boolean updateSeatType(SeatType type);
22  }
23
24  public class Reservation {
25    private int reservationID;
```

```
25    private int reservationID;
26    private Date timeOfReservation;
27    private int peopleCount;
28    private ReservationStatus status;
```

Menu, MenuSection, and MenuItem: Each restaurant branch will have its own menu, each menu will have multiple menu sections, which will contain menu items:

Java

```
1  public class MenuItem {
2    private int menuItemID;
3    private String title;
4    private String description;
5    private double price;
6
7    public boolean updatePrice(double price);
8  }
9
10 public class MenuSection {
11   private int menuSectionID;
12   private String title;
13   private String description;
14   private List<MenuItem> menuItems;
15
16   public boolean addMenuItem(MenuItem menuItem);
17 }
18
19 public class Menu {
20   private int menuID;
21   private String title;
22   private String description;
23   private List<MenuSection> menuSections;
24
25   public boolean addMenuSection(MenuSection menuSection);
26   public boolean print();
27 }
28
```

Order, Meal, and MealItem: Each order will have meals for table seats:

Java

```java
public class MealItem {
  private int mealItemID;
  private int quantity;
  private MenuItem menuItem;

  public boolean updateQuantity(int quantity);
}

public class Meal {
  private int mealID;
  private TableSeat seat;
  private List<MenuItem> menuItems;

  public boolean addMealItem(MealItem mealItem);
}

public class Order {
  private int OrderID;
  private OrderStatus status;
  private Date creationTime;

  private Meal[] meals;
  private Table table;
  private Check check;
  private Waiter waiter;
  private Chef chef;

  public boolean addMeal(Meal meal);
```
